Kinematics

Notation

a_x is the component of the vector $\vec{a}$ along the x direction.

a_y is the component of the vector $\vec{a}$ along the y direction.

Figure 1

Problems

Gimp the golfer hits a ball at point '0' in x direction with an initial speed v_o at an angle θ_o with respect to the horizontal. The ball lands at point '1' on a hill 7.6 meters above the point '0'. The ball lands with a speed $v_{of} = 49\ ^m/s$ at an angle of 31° to the horizontal.

1

1. *Swinging up the hill:*

(a) The equations governing the motion of the ball in the uphill swing are

$$v_x = v_{ox} \qquad\qquad v_y = v_{oy} - gt \tag{1}$$

$$x_x = v_{ox}t \qquad\qquad y = v_{oy}t - \frac{1}{2}gt^2 \tag{2}$$

$$v_y^2 = v_{oy}^2 - 2gy \tag{3}$$

(b) Find the x-component and y-component of the velocity $\vec{v}_{of}$ with which the ball hits the hill

$$v_{of\,x} \quad = \tag{4}$$

$$v_{of\,y} \quad = \tag{5}$$

(c) Before calculating the initial velocity $\vec{v}_o$; why is it wrong to conclude that the magnitude of the initial velocity $\vec{v}_o$ is equal to the magnitude of the final velocity $\vec{v}_{of}$. Give a qualitative argument.

(d) Determine the x-component of the initial velocity $\vec{v}_o$.

$$v_{ox} = \tag{6}$$

(e) Determine the y-component of the initial velocity $\vec{v}_o$.

$$v_{oy} = \tag{7}$$

(f) What was the initial speed (magnitude of $\vec{v}_o$) of the ball?

$$|\vec{v}_o| = \tag{8}$$

(g) At what direction with the horizontal (θ_o) was the ball hit?

$$\theta_o = \hspace{7cm} (9)$$

2. *Swinging down the hill:*

Gimp hits the ball again, again in the x direction. He hits the ball from point '1' with a speed $v_1 = 40\ ^m/s$ at an angle $\theta_1 = 30^o$ with the horizontal. The ball lands at point '2' with a speed $v_{1f} = 42\ ^m/s$ at an angle $\theta_{1f} = 34^o$ with the horizontal.

(a) Write the equations governing the motion of the ball in the downhill swing.

(b) Find the x-component and y-component of the velocity $\vec{v}_1$ when the ball is hit.

$$v_{1x} = \hspace{7cm} (10)$$

$$v_{1y} = \hspace{7cm} (11)$$

(c) Find the x-component and y-component of the velocity $\vec{v}_{1f}$ with which the ball lands

$$v_{1fx} = \hspace{7cm} (12)$$

$$v_{1fy} = \hspace{7cm} (13)$$

(d) How much time 't' did the ball take to reach point '2' from point '1'. (Hint: Use the equation $v_y = v_{1y} - gt$.)

$$t = \hspace{7cm} (14)$$

3

(e) What is the distance d_2 between the point '1' and point '2'.

$$d_2 = \tag{15}$$
