QUANTUM QUALIFYING EXAM AUGUST 2007

	•	

Aug-2007

PROBLEM 1

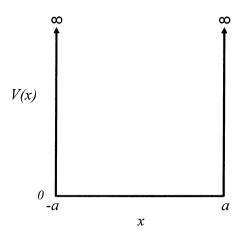

The wave function of a particle of mass m in free space is approximated by $\phi(\vec{r}) = Ne^{i\vec{k}\cdot\vec{r}}$ where \vec{k} is a constant and N is a normalization constant.

- [a] (4 pts) What would be the result of a measurement of the momentum of the particle? Explain your answer.
- [b] (4 pts) What would be the result of a measurement of the energy of the particle? Explain your answer.
- [c] (2 pts) What would be the result of a measurement of the position of the particle? Explain your answer.

PROBLEM 2

Consider the one-dimensional infinite-well potential shown above.

[a] (4pts) Derive expressions for the energy eigenfunctions and energy eigenvalues for a particle in the one-dimensional infinite well shown above. Show your work.

[b] (4pts) Now suppose a perturbation of the form

$$\Delta V(x) = V_o a \, \delta(x)$$

is added with $V_o << \frac{\hbar^2 \pi^2}{ma^2}$. Here $\delta\left(x\right)$ is the Dirac-delta function. According to first order perturbation theory, what are the eigenenergies of each state?

[c] (2pts) According to first order perturbation theory, what is the wave function of the ground state? Write your answer in terms of a, V_o , fundamental constants, and the unperturbed wave functions $\phi_n(x)$. You do not have to normalize the wave function.

4)
$$\frac{1}{\sqrt{n}} (x) = \frac{1}{\sqrt{n}} \cos\left(\frac{n\pi x}{\alpha L}\right) \quad nodd$$

$$\frac{1}{\sqrt{n}} (x) = \frac{1}{\sqrt{n}} \sin\left(\frac{n\pi x}{\alpha L}\right) \quad nodd$$

$$E_{n}^{(i)} = \langle n^{(i)} | H' | N^{(i)} \rangle$$

$$= \int_{-\infty}^{+\alpha} \left(\Psi_{n}^{*} \propto \right) \sqrt{\alpha} \delta(x) \Psi_{n}(x)$$

$$= \frac{\sqrt{\alpha} \alpha}{\alpha - \alpha} \int_{-\alpha}^{-\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) \delta(x) \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

$$= \sqrt{\alpha} \int_{-\alpha}^{-\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) \delta(x) \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

$$= \sqrt{\alpha} \int_{-\alpha}^{-\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) \delta(x) \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

$$= \int_{-\alpha}^{\alpha} \frac{(n)}{\alpha L} dx + \int_{-\alpha}^{\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

$$= \int_{-\alpha}^{\alpha} \frac{(n)}{\alpha L} dx + \int_{-\alpha}^{\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

$$= \int_{-\alpha}^{\alpha} \frac{(n)}{\alpha L} dx + \int_{-\alpha}^{\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

$$= \int_{-\alpha}^{\alpha} \frac{(n)}{\alpha L} dx + \int_{-\alpha}^{\alpha} \cos\left(\frac{n\pi x}{\alpha L} \right) dx$$

A particle of mass m has a potential energy represented by two one-dimensional harmonic oscillator potentials centered at $\pm a$:

$$V(x) = \frac{1}{2}K(x-a)^2 + \frac{1}{2}K(x+a)^2$$

- [a] (3 pts) What are the eigenvalues of the particle given this potential V? You may derive this result from first principles or deduce the result from the well known eigenvalues of a particle moving in a single harmonicoscillator potential.
- [b] (3 pts) The normalized ground-state eignefunction of the particle is given

$$\phi(x) = \frac{1}{\pi^{1/4} \Delta^{1/2}} \exp\left(-\frac{x^2}{2\Delta^2}\right)$$

Use Schrödinger's equation to determine the constant Δ in terms of K, m, and fundamental constants.

[c] (4 pt) The potential well at x = -a suddenly disappears, leaving the particle in a new potential

$$U(x) = \frac{1}{2}K(x-a)^2$$

Suppose that before the sudden change, the particle was in the ground state of the double-well potential V(x). Derive an expression for the probability that after the sudden change the particle will be in the ground state of the single well potential U(x). Express your answer in terms of a and Δ .

$$\langle r \rangle = \frac{3}{2} a_0$$

$$\langle r \rangle = \frac{3}{2} \alpha c$$

$$V(x) = \frac{1}{2} K(x-a)^2 + \frac{1}{2} K(x+a)^2$$

a) The eigenstate of the particle can be written as In>

$$H = \frac{\hat{p}^{2}}{am} + V(x) = \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}Kx^{2} + K\alpha^{2}$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}^{2}}{2m} + \frac{1}{2}K \left[(x-\alpha)^{2} + (x+\alpha)^{2} \right]$$

$$= \frac{\hat{p}$$

 $H = -\frac{\tan \omega}{2} \frac{1}{am} (a-a^{\dagger})^{2} + \frac{1}{2} K \frac{\pi}{am\omega} (a+a^{\dagger})^{2} + K d^{2}$ $= -\frac{\tan \omega}{4} [(a)^{2} + (a^{\dagger})^{2} - a a^{\dagger} - a^{\dagger} a] + \frac{\tan \omega}{4} [a^{2} + (a^{\dagger})^{2} + a a^{\dagger} + a^{\dagger} a] + K d^{2}$ $= \frac{\tan \omega}{2} (a a^{\dagger} + a^{\dagger} a) + K d^{2}$

$$\Rightarrow \frac{\chi^{2}}{\Delta^{4}} \Phi(x)$$

Aug. 2007

PROBLEM 4

A beam of spin-1/2 particles traveling in the y direction is sent through a Stern-Gerlach apparatus in which the magnetic field is inhomgeneous in the z direction, with $g\,\mu_B\,\partial B/\partial z < 0$. Here g is the g-factor of the particles, μ_B the Bohr magneton, and B the magnetic field. Two beams emerge from the apparatus. The beam that emerges with a velocity whose z component is positive (the beam traveling upward) enters a second Stern-Gerlach apparatus. The inhomgeneity in this second magnet is aligned along the unit vector $\hat{\bf e} = \sin\theta\,\hat{\bf x} + \cos\theta\,\hat{\bf y}$

[a] (2pts) Derive an expression for the elements of the 2×2 matrix

$$\mathbf{S} = (\hbar/2)\boldsymbol{\sigma} \cdot \hat{\mathbf{e}} = \frac{\hbar}{2}(\sigma_x e_x + \sigma_y e_y + \sigma_z e_z)$$

where σ_x , σ_y , and σ_z are the Pauli Spin matrices. Expression each matrix element in terms of \hbar and the angle θ of the unit vector $\hat{\mathbf{e}}$.

- [b] (2pts) What are the eigenvalues of S? Justify your answer.
- [c] (3pts) Determine the normalized eigenvectors of the matrix S.
- [d] (3pts) Derive expressions for the relative probability that the particles will be deflected into each of the two beams that emerge from the second Stern-Gerlach apparatus.

PROBLEM 5

Consider a particle of mass m and charge e which is in perpendicular electric and magnetic fields: $\vec{E} = E \,\hat{z}, \; \vec{B} = B \,\hat{y}$. The Hamiltonian for this system is given by

 $H = rac{1}{2m} \left((p_x - rac{eBz}{c})^2 + p_y^2 + p_z^2
ight) - eEz$

- [a] (6pts) Find the eigenvalues of this system. (Hint: Exploit the method of separation of variables, writing the eigenfunction as $\phi(\vec{r}) = \psi(z)e^{i(k_x x + k_y y)}$ where k_x and k_y are constants.)
- [b] (4pts) Find the average speed in the x direction for any eigenstate.

				•

PROBLEM 6

Two spinless particles of mass m_1 and m_2 have a reduced mass m_1 $m_1 m_2/(m_1 + m_2)$. One has a charge e and the other -e. Together they form a hydrogen-like atom.

[a] (1 pt) Ignoring spin, the ground state wave function of the atom is given

$$\phi_{n\ell m} = \phi_{100} = \frac{1}{\sqrt{\pi}} \left(\frac{1}{a_o}\right)^{3/2} \exp(-\frac{r}{a_o})$$

whereas the wave functions of the n=2 levels are given by

$$\begin{split} \phi_{200} &= \frac{1}{(8\pi a_o^3)^{1/2}} \left(1 - \frac{r}{2a_o}\right) \exp[-\frac{r}{2a_o}] \\ \phi_{21m} &= \frac{1}{(24a_o^3)^{1/2}} \left(\frac{r}{a_o}\right) \exp[-\frac{r}{2a_o}] \, Y_{1m}(\theta,\phi), \ m = -1,0,1. \end{split}$$

Use the time-independent form of Schrodinger's equation for this hydrogenlike atom and the ground-state wave function to derive expressions for a_a and the ground-state energy E_{100} . Write your second state of the sec and fundamental constants.

- [b] (1 pt) What is the difference in energy ΔE between the n=2 and n=1
- [c] (2pts) The 25 integrals of the form

$$\langle \phi_{n\ell m} | \, \vec{r} \, | \phi_{n'\ell'm'} \rangle$$

can be constructed from the five states listed in part [a]. Use parity arguments to determine which of these integrals are zero.

[d] (3pts) By writing

evaluate the integrals $\langle \varphi_{2\ell m} | \vec{r} | \phi_{2\ell' m'} \rangle$ that are not zero. have to evaluate integrals involving the n=1 state.)

- [e] [1 pt] Now assume a field $E_o \hat{z}$ is applied to the system with $eE_o a_o \ll$ ΔE . In this case, the perturbation of the ϕ_{100} state is expected to be very small. Why?
- [f] [2 pts] Derive expressions for the energies of the system. Consider only energies that correspond to n=2 states when the field strength is zero. Discuss in words and a sketch the degeneracy (if an) of these eigenstates when the field strength is nonzero, $E_o > 0$.

		• •

$$Q \cdot \frac{d^2 \phi_{100}}{dr^2} + \frac{2m}{h^2} \left[E_{100} + \frac{e^2}{r} \right] \phi_{100} = 0$$

$$= \frac{1}{\sqrt{\pi a_0^3}} \left(-\frac{1}{a_0}\right)^2 e^{-\frac{r}{a_0}} + \frac{2m}{\pi^2} \left[E_{100} + \frac{e^2}{r} \right] \phi_{100} = 0$$

$$\Rightarrow \frac{1}{\sqrt{a_0}} \left(\frac{1}{\sqrt{a_0}} + \frac{2m}{\sqrt{a_0}} \right) = 0$$

$$= \frac{5}{2} = -\frac{5}{2} = -\frac{6^2}{4}$$

·
