1. Use the three-dimensional Levi-Civita symbol, $\epsilon_{ijk}$, which has the properties of being totally antisymmetric in all three indices,

$$\epsilon_{ijk} = \epsilon_{jki} = \epsilon_{kij} = -\epsilon_{jik} = -\epsilon_{kji} = -\epsilon_{ikj},$$

and is normalized to unity,

$$\epsilon_{123} = +1$$

to define the cross product in terms of the Cartesian components of vectors:

$$\mathbf{A} = \mathbf{B} \times \mathbf{C} \iff A_i = \epsilon_{ijk} B_j C_k,$$

which uses the summation convention for repeated indices, for example,

$$A_i B_i = \sum_{i=1}^{3} A_i B_i = \mathbf{A} \cdot \mathbf{B}.$$

Prove the identity

$$\epsilon_{ijk} \epsilon_{klm} = \delta_{il} \delta_{jm} - \delta_{im} \delta_{jl},$$

where $\delta_{ij}$ is the Kronecker delta symbol,

$$\delta_{ij} = \begin{cases} 1, & i = j, \\ 0, & i \neq j. \end{cases}$$

Show this is equivalent to the familiar identity

$$\mathbf{A} \times (\mathbf{B} \times \mathbf{C}) = \mathbf{B}(\mathbf{A} \cdot \mathbf{C}) - \mathbf{C}(\mathbf{A} \cdot \mathbf{B}),$$

provided $\mathbf{A}$, $\mathbf{B}$, and $\mathbf{C}$ are commuting vectors.
2. Show that the following functions represent the delta function in one dimension by showing that

\[ \delta_\varepsilon(x \neq 0) \to 0 \text{ as } \varepsilon \to 0+, \]

and

\[ \int_{-\infty}^{\infty} dx \delta_\varepsilon(x) = 1. \]

(a) \[ \delta_\varepsilon(x) = \frac{1}{\sqrt{\pi \varepsilon}} e^{-x^2/\varepsilon}, \]

(b) \[ \delta_\varepsilon(x) = \frac{\varepsilon}{\pi x^2 + \varepsilon^2}, \]

(c) \[ \delta_\varepsilon(x) = \int_{-\infty}^{\infty} \frac{dk}{2\pi} e^{ikx-|k|\varepsilon}. \]
