

E & M Qualifier

August 16, 2012

To insure that the your work is graded correctly you MUST:

1. use only the blank answer paper provided,
2. write only on one side of the page,
3. put your alias on every page,
4. put the problem # on every page,
5. number every page starting with 1 for each problem,
6. put the total # of pages you use for that problem on every page,

Use only the reference material supplied (Schaum's Guides).

1. A long wire of radius R_{wire} carries a current I and is surrounded by a long hollow iron cylinder. The inner radius of the cylinder is R_i and the outer radius is R_o ($R_{wire} < R_i < R_o$, see the figure, assume the current flows out of the page).
 - (a) (2 pts) Compute the flux of \mathbf{B} through a rectangular section of the iron cylinder L meters long and $R_o - R_i$ wide.
 - (b) (3 pts) Find the bound surface current densities flowing along the inner and outer iron surfaces, respectively K_i^b and K_o^b , and find the direction of these currents relative to the current in the wire.
 - (c) (2 pts) Find the bound volume current density J^b inside the iron.
 - (d) (3 pts) Find \mathbf{B} at distances $r > R_o$ from the wire. Would this value of \mathbf{B} be affected if the iron cylinder were removed?

Recall that the magnetization \mathbf{M} is related to the magnetic field strength \mathbf{H} and the susceptibility χ_m by

$$\begin{aligned}
 \mathbf{M} &= \chi_m^{SI} \mathbf{H} && \text{in SI units} \\
 &= \chi_m^G \mathbf{H} && \text{in Gaussian units} \\
 \mathbf{B} &= \mu_0(\mathbf{H} + \mathbf{M}) = \mu_0(1 + \chi_m^{SI})\mathbf{H} && \text{in SI units} \\
 &= (\mathbf{H} + 4\pi\mathbf{M}) = (1 + 4\pi\chi_m^G)\mathbf{H} && \text{in Gaussian units}
 \end{aligned}$$

For all substances $4\pi\chi_m^G = \chi_m^{SI}$. For iron χ_m is in the range 10 to 1000.

2. (a) (3 pts) From Maxwell's Equations, derive the wave equation for \mathbf{E} with no sources ($\rho = 0, \mathbf{J} = 0$) in a homogeneous, isotropic, linear medium of permittivity ϵ and permeability μ .

- (b) (1 pts) Show that if $\mathbf{E} = E(t, z) \hat{\mathbf{y}}$, the wave equation reduces to

$$\begin{aligned} \frac{\partial^2 E}{\partial z^2} &= \epsilon\mu \frac{\partial^2 E}{\partial t^2}, & \text{in SI units} \\ \frac{\partial^2 E}{\partial z^2} &= \frac{\epsilon\mu}{c^2} \frac{\partial^2 E}{\partial t^2}. & \text{in Gaussian units} \end{aligned}$$

- (c) (4 pts) By introducing the change of variables

$$\begin{aligned} \xi &= t + \sqrt{\epsilon\mu} z, & \text{in SI units} \\ \xi &= ct + \sqrt{\epsilon\mu} z, & \text{in Gaussian units} \\ \eta &= t - \sqrt{\epsilon\mu} z, & \text{in SI units} \\ \eta &= ct - \sqrt{\epsilon\mu} z, & \text{in Gaussian units} \end{aligned}$$

show that the wave equation assumes a form that is easily integrated.

- (d) (2 pts) Integrate the equation to obtain

$$E(z, t) = E_1(\xi) + E_2(\eta),$$

where E_1 and E_2 are arbitrary functions.

E+M #2

Gaussian

a) Maxwells eqns:

$$\nabla \cdot \vec{D} = 4\pi \vec{\rho}^0 \quad \nabla \cdot \vec{B} = 0$$

$$\nabla \times \vec{E} + \frac{1}{c} \frac{\partial \vec{B}}{\partial t} = 0 \quad \nabla \times \vec{H} - \frac{1}{c} \frac{\partial \vec{D}}{\partial t} = \vec{j}^0$$

To derive wave eqn ($-\nabla^2 \vec{E} = -\frac{\mu\epsilon}{c^2} \frac{\partial^2 \vec{E}}{\partial t^2}$)

$$\nabla \times (\nabla \times \vec{E}) + \frac{1}{c} \nabla \times \frac{\partial \vec{B}}{\partial t} = 0$$

$$\nabla (\vec{\nabla} \cdot \vec{E}) - \nabla^2 \vec{E} + \frac{1}{c} \frac{\partial}{\partial t} (\nabla \times \mu \vec{H}) = 0$$

$$-\nabla^2 \vec{E} + \frac{1}{c} \frac{\partial}{\partial t} \left(\mu \frac{\partial \vec{D}}{\partial t} \right) = 0$$

$$-\nabla^2 \vec{E} + \frac{1}{c} \frac{\partial}{\partial t} \left(\mu\epsilon \frac{\partial \vec{E}}{\partial t} \right)$$

$$-\nabla^2 \vec{E} + \frac{\mu\epsilon}{c^2} \frac{\partial^2 \vec{E}}{\partial t^2} = 0 \checkmark$$

b) If $\vec{E} = E(t, z) \hat{y}$

$$-\nabla^2 = -\frac{\partial^2}{\partial x^2} - \frac{\partial^2}{\partial y^2} - \frac{\partial^2}{\partial z^2}$$

$$\hookrightarrow -\nabla^2 E = \frac{\partial^2 E}{\partial z^2}$$

$$-\frac{\partial^2 E}{\partial z^2} + \frac{\mu\epsilon}{c^2} \frac{\partial^2 E}{\partial t^2} = 0 \Rightarrow \frac{\partial^2 E}{\partial t^2} = \frac{\mu\epsilon}{c^2} \frac{\partial^2 E}{\partial z^2}$$

c) Introducing the following variable substitutions: $\zeta = ct + \sqrt{\mu\epsilon} z$

$$\eta = ct - \sqrt{\mu\epsilon} z$$

$$\begin{aligned} \frac{\partial}{\partial z} &= \frac{\partial \zeta}{\partial z} \frac{\partial}{\partial \zeta} + \frac{\partial \eta}{\partial z} \frac{\partial}{\partial \eta} \\ &= \sqrt{\mu\epsilon} \frac{\partial}{\partial \zeta} - \sqrt{\mu\epsilon} \frac{\partial}{\partial \eta} = \sqrt{\mu\epsilon} \left(\frac{\partial}{\partial \zeta} - \frac{\partial}{\partial \eta} \right) \end{aligned}$$

$$\begin{aligned} \frac{1}{c} \frac{\partial}{\partial t} &= \frac{\partial \zeta}{\partial t} \frac{\partial}{\partial \zeta} + \frac{\partial \eta}{\partial t} \frac{\partial}{\partial \eta} \\ &= c \frac{\partial}{\partial \zeta} + c \frac{\partial}{\partial \eta} = \frac{\partial}{\partial \zeta} + \frac{\partial}{\partial \eta} \end{aligned}$$

#2 (cont.)

$$c) \Rightarrow -\frac{\partial^2}{\partial z^2} = \mu E \left(-\frac{\partial^2}{\partial z^2} + 2 \frac{\partial}{\partial z} \frac{\partial}{\partial n} - \frac{\partial^2}{\partial n^2} \right)$$

$$\frac{\mu E}{c^2} \frac{\partial}{\partial t^2} = \mu E \left(\frac{\partial^2}{\partial z^2} + 2 \frac{\partial}{\partial z} \frac{\partial}{\partial n} - \frac{\partial^2}{\partial n^2} \right)$$

$$\Rightarrow -\frac{\partial^2 E}{\partial z^2} + \frac{\mu E}{c^2} \frac{\partial^2 E}{\partial t^2} = 4 \mu E \frac{\partial^2}{\partial z \partial n} E = 0$$

d)

3. Two charges $\pm q$ are on opposite sides of a dielectric sphere ($\epsilon = \text{constant}$) as shown in the figure. The three objects are on a common axis, the sphere is of radius a and the two charges are a distance $b > a$ from the sphere's center.
- (2 pts) Give the form of potential $\Phi(r, \theta)$ inside the sphere ($r < a$) as a series of Legendre polynomials, $P_\ell(\cos \theta)$, with coefficients A_ℓ . Give the correct r dependence of each term and do not include ℓ values that vanish from symmetry.
 - (2 pts) Give the form of the potential $\Phi(r, \theta)$ outside the sphere ($r > a$) as the sum of two terms; one a series of Legendre polynomials with coefficients B_ℓ caused by the polarization charges on the dielectric, and the other term caused by the two point charges. In the series part keep only non-vanishing ℓ values and give the correct r dependence of each term.
 - (3 pts) In the outside region where $r > a$, expand the part of the potential caused by the point charges as a single series in P_ℓ . Give two explicit forms of this series, one good for $a < r < b$ and one good for $r > b$.
 - (3 pts) You do not have to evaluate the constants A_ℓ and B_ℓ but write down the two sets of equations from which you can determine them (the boundary matching conditions).

4. The reflection of a circularly polarized plane wave at a metallic boundary.

- (a) (2 pts) Give expressions for the \mathbf{E} and \mathbf{B} fields of a monochromatic, right circularly polarized plane wave traveling in vacuum. Use rectangular Cartesian coordinates, assume the angular frequency is ω , assume the polarization plane is the x - y plane, and assume the propagation direction is in the positive z direction.
- (b) (1 pt) Explain in words what is meant by a monochromatic right circularly polarized wave.
- (c) (2 pts) Rewrite your \mathbf{E} and \mathbf{B} fields of part (a) assuming the propagation direction is 30° above the \hat{z} direction as shown in the figure. You can use unit vectors $\hat{\mathbf{e}}$ and $\hat{\mathbf{k}}$ in your expressions but be sure to define what they are in terms of the coordinate directions $\hat{\mathbf{x}}$, $\hat{\mathbf{y}}$, and $\hat{\mathbf{z}}$.
- (d) (2 pts) If the wave of part (c) strikes a flat perfectly conducting surface at $z = 0$ it will be reflected. What boundary conditions are satisfied by the combined \mathbf{E} and \mathbf{B} fields of the incoming and reflected waves at the $z = 0$ junction?
- (e) (2 pts) Give expressions for the reflected \mathbf{E} and \mathbf{B} fields. Make sure they satisfy your junction conditions of part (d).
- (f) (1 pt) Is the reflected wave right or left circularly polarized?

5. An infinitely long, uniformly charged wire of radius a and total charge per unit length λ , is at rest on the z -axis of the lab frame.

- (a) (2 pts) Compute the electric field $\mathbf{E}(x, y, z)$ interior and exterior to the wire in the lab frame by solving Gauss's law in that frame.
- (b) Complete the next 4 steps to compute $\mathbf{E}'(x', y', z')$ and $\mathbf{B}'(x', y', z')$ in a frame moving in the positive z -direction with speed v .
 - i. (2 pts) Give the Lorentz boost $x'^{\sigma} = L_{\mu}^{\sigma} x^{\mu}$ ($\mathbf{x}' = \mathbf{L}\mathbf{x}$) from the Lab to the moving frame (take $x^0 = ct, x^1 = x, x^2 = y, x^3 = z$).
 - ii. (2 pts) Construct the electromagnetic field tensor $F^{\alpha\beta}$ from the electric field you found in part (a).
 - iii. (2 pts) Use your lorentz boost to compute the electromagnetic field tensor $F'^{\alpha\beta} = L_{\mu}^{\alpha} L_{\nu}^{\beta} F^{\mu\nu}$ ($\mathbf{F}' = \mathbf{LFL}^T$) in the moving frame.
 - iv. (2 pts) From your $F'^{\alpha\beta}$ give the answer to (b).

Hint: Recall that in both SI and Gaussian units $F^{\sigma\mu} = -F^{\mu\sigma}$ and $F^{0i} = -E^i$. In Gaussian units $F^{12} = -B^z$, $F^{23} = -B^x$ and $F^{13} = B^y$, but in SI units $F^{12} = -c B^z$, $F^{23} = -c B^x$ and $F^{13} = c B^y$

E+M #5

Gaussian

①

a) We can use Gauss' Law to find \vec{E}

$$\int \nabla \cdot \vec{E} = \int 4\pi \rho$$

$$\oint \vec{E} \cdot d\vec{a} = 4\pi Q_{enc}$$

* If we are at $r > a$:

$$\oint \vec{E} \cdot d\vec{a} = 4\pi \lambda L$$

$$E \cdot 2\pi L r = 4\pi \lambda L$$

$$\vec{E} = \frac{2\lambda}{r} \hat{r}$$

$$= \frac{2\lambda}{\sqrt{x^2+y^2}} \langle \cos \varphi, \sin \varphi, 0 \rangle \quad (\text{in Cartesian})$$

* If $r < a$:

$$Q_{enc} = \frac{\lambda r^2 L}{a^2} \quad \text{since wire is uniformly charged}$$

$$\hookrightarrow \oint \vec{E} \cdot d\vec{a} = 4\pi \frac{\lambda r^2 L}{a^2}$$

$$E \cdot 2\pi L r = \frac{4\pi L \lambda r^2}{a^2}$$

$$\vec{E} = \frac{2\lambda r}{a^2} \hat{r}$$

$$= \frac{2\lambda \sqrt{x^2+y^2}}{a^2} \langle \cos \varphi, \sin \varphi, 0 \rangle$$

$$\Rightarrow E = \begin{cases} \frac{2\lambda \sqrt{x^2+y^2}}{a^2} \langle \cos \varphi, \sin \varphi, 0 \rangle & \text{if } r < a \\ \frac{2\lambda}{\sqrt{x^2+y^2}} \langle \cos \varphi, \sin \varphi, 0 \rangle & r > a \end{cases}$$

#5 (cont.)

b) i) For a boost of velocity v in \hat{z} direction:

$$L = \begin{bmatrix} \gamma & 0 & 0 & -\beta\gamma \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\beta\gamma & 0 & 0 & \gamma \end{bmatrix}$$

$$\Rightarrow x'^{\sigma} = L^{\sigma}_{\mu} x^{\mu}$$

$$\begin{bmatrix} ct' \\ x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} \gamma & 0 & 0 & -\beta\gamma \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\beta\gamma & 0 & 0 & \gamma \end{bmatrix} \begin{bmatrix} ct \\ x \\ y \\ z \end{bmatrix}$$

$$\begin{bmatrix} ct' \\ x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} \gamma ct - \beta\gamma z \\ x \\ y \\ -\beta\gamma ct + \gamma z \end{bmatrix}$$

$$\text{ii) } F^{\alpha\beta} = \begin{bmatrix} 0 & -E_x & -E_y & -E_z \\ E_x & 0 & -B_z & B_y \\ E_y & B_z & 0 & -B_x \\ -E_z & -B_y & B_x & 0 \end{bmatrix} = \begin{bmatrix} 0 & -\cos\phi & -\sin\phi & 0 \\ \cos\phi & 0 & 0 & 0 \\ \sin\phi & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{cases} \frac{2\lambda\sqrt{x^2+y^2}}{a^2} & r < a \\ \frac{2\lambda}{\sqrt{x^2+y^2}} & r > a \end{cases}$$

$$\text{iii) } F'^{\alpha\beta} = L^{\alpha}_{\mu} L^{\beta}_{\nu} F^{\mu\nu}$$

$$= L F L^T$$

$$= \begin{bmatrix} \gamma & 0 & 0 & -\beta\gamma \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\beta\gamma & 0 & 0 & \gamma \end{bmatrix} \begin{bmatrix} 0 & -\cos\phi & -\sin\phi & 0 \\ \cos\phi & 0 & 0 & 0 \\ \sin\phi & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \gamma & 0 & 0 & -\beta\gamma \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\beta\gamma & 0 & 0 & \gamma \end{bmatrix}$$

$$= \begin{bmatrix} 0 & -\gamma\cos\phi & -\gamma\sin\phi & 0 \\ \cos\phi & 0 & 0 & 0 \\ \sin\phi & 0 & 0 & 0 \\ 0 & \beta\gamma\cos\phi & \beta\gamma\sin\phi & 0 \end{bmatrix} \begin{bmatrix} \gamma & 0 & 0 & -\beta\gamma \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\beta\gamma & 0 & 0 & \gamma \end{bmatrix}$$

#5 (cont.)

$$b) \text{ iii) } F'^{\alpha\beta} = \begin{bmatrix} 0 & -\gamma \cos \varphi & -\gamma \sin \varphi & 0 \\ \gamma \cos \varphi & 0 & 0 & -\beta \gamma \cos \varphi \\ \gamma \sin \varphi & 0 & 0 & -\beta \gamma \sin \varphi \\ 0 & \beta \gamma \cos \varphi & \beta \gamma \sin \varphi & 0 \end{bmatrix}$$

$$iv) \quad E' = \begin{cases} \frac{\gamma \lambda \sqrt{x^2 + y^2}}{a^2} \langle \cos \varphi, \sin \varphi, 0 \rangle & r < a \\ \frac{\gamma \lambda}{\sqrt{x^2 + y^2}} \langle \cos \varphi, \sin \varphi, 0 \rangle & r > a \end{cases}$$

$$B' = \begin{cases} \frac{\beta \gamma \lambda \sqrt{x^2 + y^2}}{a^2} \langle \cos \varphi, -\sin \varphi, 0 \rangle & r < a \\ \frac{\beta \gamma \lambda}{\sqrt{x^2 + y^2}} \langle \cos \varphi, -\sin \varphi, 0 \rangle & r > a \end{cases}$$

6. In the absence of polarizable and/or magnetizable material (i.e., only free charges and currents present) Maxwell's equations, in Gaussian units and in the Lorentz gauge, reduce to the inhomogeneous wave equation:

$$\square \begin{pmatrix} \Phi \\ A^x \\ A^y \\ A^z \end{pmatrix} = \frac{4\pi}{c} \begin{pmatrix} c\rho \\ J^x \\ J^y \\ J^z \end{pmatrix}, \text{ where } \square \equiv \left(\frac{\partial}{c\partial t} \right)^2 - \nabla^2.$$

A time dependent charge $Q(t) = I_0 t$, $t \geq 0$ is fixed at the origin

of a cylindrical polar coordinate system (ρ, ϕ, z) . The charge increases linearly with time because a constant current I_0 flows in along a thin wire attached to the charge on its left, see the figure. Assume the wire carries no current for $t < 0$, however, at $t = 0$ a current I_0 abruptly starts flowing in the $+z$ direction and remains constant for $t \geq 0$. Assume the wire remains neutral as the charge at the origin grows. Find the following quantities at time t for points (ρ, ϕ, z) :

- (a) (2 pts) The charge density $\rho(t, \rho, \phi, z)$,
- (b) (2 pts) The current density $\mathbf{J}(t, \rho, \phi, z)$,
- (c) (2 pts) The retarded scalar potential $\Phi(t, \rho, \phi, z)$,
- (d) (4 pts) The retarded vector potential $\mathbf{A}(t, \rho, \phi, z)$.

Hints: Parts (a) and (b) require the use of $\delta(x)$ -functions and Heaviside step functions $\Theta(x) \equiv 1, 0$ respectively for $x > 0$ or $x < 0$. The retarded Green's function for the \square operator is:

$$G^{ret}(\mathbf{r}, t; \mathbf{r}', t') = \frac{\delta(t - t' - |\mathbf{r} - \mathbf{r}'|/c)}{4\pi |\mathbf{r} - \mathbf{r}'|},$$

which gives retarded potentials

$$\left(\Phi(t, \mathbf{r}), \mathbf{A}(t, \mathbf{r}) \right)^{ret} = \frac{1}{c} \int \frac{\left(c\rho(t - |\mathbf{r} - \mathbf{r}'|/c, \mathbf{r}'), \mathbf{J}(t - |\mathbf{r} - \mathbf{r}'|/c, \mathbf{r}') \right)}{|\mathbf{r} - \mathbf{r}'|} d^3r'.$$

For part (d) you might need the integral

$$\int \frac{dX}{\sqrt{X^2 + a^2}} = \ln(\sqrt{X^2 + a^2} + X).$$
